# Министерство образования Республики Беларусь Учреждение образования «Брестский государственный технический университет» Кафедра ИИТ

Лабораторная работа №4 По дисциплине: «СПП»

Выполнил: Студент 3 курса Группы ПО-3 Новикевич А.А. Проверил: Монтик Н.С.

## Лабораторная работа №4

Цель работы: приобрести практические навыки в области объектно-ориентированного проектирования.

**Задание 1:** Реализовать указанный класс, включив в него вспомогательный внутренний класс или классы. Реализовать 2-3 метода (на выбор). Продемонстрировать использование реализованных классов.

Создать класс Department (отдел фирмы) с внутренним классом, с помощью объектов которогоможно хранить информацию обо всех должностях отдела и обо всех сотрудниках, когда-либо занимавших конкретную должность.

#### Код программы:

```
using System;
using System.Collections.Generic;
public class Department
   private String name;
   private int count;
   private class Position
       public String title;
       public int salary;
        public override string ToString()
           {
                return "Position: " + title + "\nSalary: " + salary + "$\n";
           }
   }
   private class Employee
        public String name;
        public String surname;
        public int age;
        public String employeePosition;
        public int employeeSalary;
        public override string ToString()
            return "Name" + name + "\nSurname: " + surname + "\nAge: " + age +
"\nPosition: " + employeePosition + "\nSalary: " + employeeSalary + "\n";
    }
   List<Position> positions = new List<Position>();
   public void AddPosition(String _title, int _salary)
        Position pos = new Position();
        pos.title = _title;
        pos.salary = _salary;
        positions.Add(pos);
   }
   public void show()
        Console.WriteLine("ALL positions: ");
        Console.WriteLine();
        foreach(Position pos in positions)
        {
            Console.WriteLine($"{pos.ToString()}");
        Console.WriteLine("ALL employees: ");
        Console.WriteLine();
```

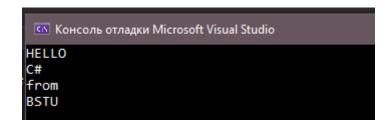

```
foreach (Employee employee in employees)
         {
              Console.WriteLine($"{employee.ToString()}");
         }
     }
    List<Employee> employees = new List<Employee>();
    public void AddEmployee (String _name, String _surname, int _age, string
_employeePosition)
    {
         foreach(Position pos in positions)
              if (pos.title == employeePosition)
                   Employee employee = new Employee();
                   employee.name = _name;
employee.surname = _surname;
                   employee.age = _age;
                   employee.employeePosition = _employeePosition;
                   employee.employeeSalary = pos.salary;
                   employees.Add(employee);
              }
         }
    }
}
namespace ConsoleApp1
    class Program
    {
         static void Main(string[] args)
         {
              Department department = new Department();
              department.AddPosition("student", 2000);
              department.AddPosition("seller", 5000);
department.AddEmployee("Artyom", "Novikevich", 20, "student");
department.AddEmployee("Gena", "Bukin", 43, "seller");
              department.show();
         }
    }
}
Результат выполнения:
ALL positions:
Position: student
Salary: 2000$
Position: seller
Salary: 5000$
ALL employees:
NameArtyom
Surname: Novikevich
Age: 20
Position: student
Salary: 2000
NameGena
Surname: Bukin
Age: 43
Position: seller
```

Salary: 5000

**Задание 2:** Реализовать агрегирование. При создании класса агрегируемый класс объявляется как атрибут (локальная переменная, параметр метода). Включить в каждый класс 2-3 метода на выбор. Продемонстрировать использование разработанных классов. Создать класс Абзац, используя класс Слово.

## Код программы:

```
using System;
using System.Collections.Generic;
class Word
{
    private String word;
    public Word(String word)
        this.word = word;
    }
    public String getWord()
    {
        return word;
    }
}
class Paragraph
    List<Word>words = new List<Word>();
    public void addWord(Word word)
        words.Add(word);
    }
    public void printALL()
        for (int i = 0; i < words.Count; i++)</pre>
            Console.WriteLine(words[i].getWord() + " ");
    }
}
namespace lab4_2
    class Program
        static void Main(string[] args)
            Word word1 = new Word("HELLO");
            Word word2 = new Word("C#");
            Word word3 = new Word("from");
            Word word4 = new Word("React");
            Paragraph paragraph1 = new Paragraph();
            paragraph1.addWord(word1);
            paragraph1.addWord(word2);
            paragraph1.addWord(word3);
            paragraph1.addWord(word4);
            paragraph1.printALL();
        }
    }
```

Задание 3: Построить модель программной системы с применением отношений (обобщения, агрегации, ассоциации, реализации) между классами. Задать атрибуты и методы классов. Реализовать (если необходимо) дополнительные классы. Продемонстрировать работу разработанной системы.

Система Библиотека. Читатель оформляет Заказ на Книгу. Система осуществляет поиск в Каталоге. Библиотекарь выдает Читателю Книгу на абонемент или в читальный зал. При невозвращении Книги Читателем он может быть занесен Администратором в «черный список».

### Код программы:

```
using System;
using System.Collections.Generic;
namespace ConsoleApp2
{
    class Program
    {
        static void Main(string[] args)
            String[] bookNames = { "Dead inside", "BSTU MAP", "Dead souls" };
            Library library = new Library();
            //create books
            Book[] books = { new Book(bookNames[0], "Bulgakov", 12),
                new Book(bookNames[1], "Gogol", 3),
